Open to senior backend engineering roles - India · Remote

SUMMARY

Senior Backend Engineer with 10+ years building production-grade backend systems, distributed services, APIs and cloud infrastructure. I build and operate backend systems across their full lifecycle - from API and service design to messaging, cloud infrastructure, deployment, testing, and production observability - across polyglot backend environments. Currently technical anchor for customer identity, distributed systems, and API platforms at Enpal, driving architecture through RFCs and architecture decisions. Open to senior backend engineering roles focused on distributed systems, scalable APIs, and production-grade platforms.

EXPERIENCE

Senior Software Engineer - Enpal

2025 - Present | Berlin, Germany

Technical anchor for customer identity, distributed systems, and API platforms across a multi-service energy-tech backend.

- Designed a customer-detection workflow combining address normalization, Azure Maps, and CRM intelligence to identify potential multi-site customers from incoming leads.
- Designed a deterministic identity-generation service producing consistent 10-digit PersonIDs, supporting up to 10 billion identifiers within each yearly namespace for reliable customer identity resolution.
- Built live and historical address-matching workflows that reconcile normalized customer addresses across MongoDB and CRM systems, including large-scale backfill processing.
- Extended a reusable domain-ID generation platform to support additional consumers while maintaining compatibility across existing services.
- Built and evolved customer and order APIs supporting customer lifecycle workflows, CRM integrations, and service-to-service communication across a polyglot backend.
- Built an AI-assisted CI workflow that analyzes OpenAPI diffs, detects potential breaking changes, and prepares synchronized updates across application and API specification repositories.
- Authored 10+ architecture decision records and introduced resilience patterns that improved failure handling across downstream services and event-driven integrations.
- Led the deprecation of legacy applications and messaging resources, reducing the cloud footprint by 30%+.
- Redesigned sequential CI pipelines into parallel multi-stage workflows using build artifacts, reducing pull-request build and merge time from 12-14 minutes to 5.5 minutes.
- Automated development and staging deployments after pull requests are merged, replacing manual environment-specific tagging and reducing repetitive developer effort.
- Established layered test coverage across unit, integration, end-to-end, and load testing for backend services with CRM and external-system dependencies.

Senior Software Engineer - Phreesia

2023 - 2025 | Remote

Platform modernisation for a healthcare engagement backend, coordinated asynchronously across product and engineering.

- Led architecture discussions to modernize a legacy distributed backend runtime, lifting performance 35% and cutting error rates 25%.
- Designed decentralized secret-management protocols across microservices, establishing secure configuration standards.
- Built automated CI/CD pipelines and containerized backend services with Docker, cutting deployment times 50%.

Senior Software Engineer - Coditas

2022 - 2023 | India

Cloud-native microservices for a distributed enterprise sales platform at sustained production volume.

- Built highly available microservices and API workflows processing 100,000+ daily service calls.
- Established centralized observability standards - Grafana, Datadog, OpenTelemetry - accelerating release cycles 40%.

Software Engineer - Aventri

2020 - 2022 | India

Real-time communication infrastructure for an enterprise events platform.

- Architected a real-time, distributed communication system scaling to 10,000+ concurrent enterprise users.
- Engineered 20+ reusable components and backend optimizations, reducing system load times 30%.

Software Engineer - Capgemini (Client: AON)

2016 - 2020 | India

Backend integrations for a global risk-mitigation platform at enterprise scale.

- Maintained backend API integrations and optimized service-request workflows for 66,000+ distributed enterprise users, improving task completion times 25%.

SELECTED PROJECTS

Multisite Customer Detection

Customer-detection workflow combining address normalization, Azure Maps, and CRM intelligence to identify potential multi-site customers from incoming leads.

PersonId & Identity Resolution

Deterministic identity-generation service producing consistent 10-digit PersonIds - up to 10 billion identifiers within each yearly namespace - unifying fragmented customer identities across systems.

Address Matching & Data Backfill

Live and historical address-matching workflows reconciling normalized customer addresses across MongoDB and CRM systems, including large-scale backfill processing.

AI-Assisted API Contract Governance

AI-assisted CI workflow analyzing OpenAPI diffs, detecting potential breaking changes, and preparing synchronized updates across application and API specification repositories.

Distributed Rate Limiter (personal)

Production-style distributed rate limiter in Go using a Redis sliding-window log, shipped with benchmarks, containerized deployment, CI, and observability hooks.

CI Pipeline Parallelization

Redesigned sequential CI pipelines into parallel multi-stage workflows using build artifacts, cutting pull-request build and merge time from 12-14 minutes to 5.5 minutes.

ENGINEERING STACK

Languages	Go, C#, TypeScript, JavaScript
Backend & APIs	.NET, Node.js, REST, Microservices, FastEndpoints, gRPC, Azure Functions
Distributed Systems	Distributed Systems, Event-Driven Architecture, Message Queues, Resilience, Service-to-Service Communication
Data & Messaging	MongoDB, MySQL, Redis, Kafka, RabbitMQ, Azure Service Bus
Cloud & Infra	AWS, Azure, GCP, Terraform, Docker
Testing & Quality	Unit Testing, Integration Testing, E2E Testing, Load Testing, Test Pyramid
CI/CD & Delivery	GitLab CI, CI/CD, Pipeline Optimization, Build Artifacts, Deployment Automation
Architecture	API Design, OpenAPI, Architecture Decisions, System Design, Legacy Modernization, Cloud Optimization
Observability	OpenTelemetry, Datadog, Grafana

EDUCATION & CERTIFICATIONS

- B.Tech, Computer Science - Lovely Professional University, 2012 - 2016

- AWS Certified Cloud Practitioner - Amazon Web Services
